Assignment 05 – Advanced Collections and Error Handling

Introduction

This document outlines the steps I took to complete Assignment 05 in the IT FDN 100 A. In this assignment, I was asked to create a program that allowed the user to load data from a JSON, iteratively add data a number of times, and save that data into a JSON. It included error handling.

Steps Taken

I began by opening that assignment starter and modifying the constants and variables as outlined in the assignment.

I next modified the starter file to use JSON rather than CSV and dictionaries rather than lists.

Finally, I added the requested error handling following the structure outlined in the labs.

I encountered one bug: I had neglected to update my print on save from working with lists and csvs to working with JSON. After resolving this bug, the code appears to run fine.

Summary

This document uses plain English to outline the steps I took to complete Assignment 05 for this class.
